

Additional Modules (1)

OVERVIEW

As well as the outstanding portfolio of standard functionality, **Priority** boasts a wealth of additional modules designed to enable companies in specific industries to gain advantage over their competitors. Business areas not normally catered for within ERP systems are now dealt with uniquely within the **Priority** solution.

ADVANCED CASH FLOW

Where businesses deal with large volumes of finance-only dealings, **Priority** has the capability of managing those transactions in an automated fashion. Requirements such as recurring journals, maybe stretching over several fiscal years, and factoring of debts are dealt with simply within this special module.

IMPORT / EXPORT FILES

Where an organisation deals extensively in an export market, special requirements become important. Many exporters are responsible for the costs of shipping their goods to customers. This module allows the shipping burden to be added to your product cost. Management of the shipment is also catered for including the tracking of

TRAVEL EXPENSES

Where your business is heavily service based or there is a large sales force, employees incur many travelling expenses, some of which may become customer-billable. **Priority** handles this scenario within the Travel Expenses module allowing easy logging of expenses and automatic billing where appropriate.

DECISION SUPPORT

For organisations that have to manage many formal and informal meetings, both internally and with external parties, the decision support module of **Priority** provides many invaluable facilities. From the notification of attendees to the meeting preparation, actions, decisions, minutes and the monitoring of any required follow-up actions. Any associated documentation can also be linked.

▶ Making the most of your Priority investment with specific additional functionality.

▶ Advanced features for managing cash-flow throughout your business.

▶ Exporting companies need the features to be able to cost shipping and to track containers.

▶ This function allows travelling employees to log all their billable & non-billable expenses.

▶ Large numbers of internal meetings need management and Priority provides this.

PASSWORD VERIFICATION

Businesses working in the food and drug industries have special requirements for data security. These stipulate that for certain transactions, the user must verify who they are when completing any data entry, modification or deletion. With this module, any form or procedure throughout the system can be marked as requiring password verification. This will then require the user to enter their password before allowing them to continue.

CHANGE LOG

All transactions in the **Priority** system have user / timestamp data giving who last changed the record and when. In addition some transactions (e.g. sales orders) provide an audit history providing all changes to the transaction and what the material change was. The Change Log module allows this expanded functionality to be kept against any transaction as defined by the system manager.

INTERNAL PURCHASING

Some organisations have a business process that requires many employees to raise internal purchase requisitions. Where these employees would not normally use **Priority** for other reasons, this could result in a large increase in the number of required users. In order to keep the licensing costs to a minimum, we have produced a web-based (Marketgate) module to handle this function. This allows this function to be satisfied much more cost-effectively as such licences are counted only whilst the transaction is being saved to the database, not whenever the user is logged on.

REPORTED PRODUCTION

In a similar manner to the Internal Purchasing module, shop floor workers can report their activity to the system via this Marketgate module without the overhead of having to supply individual licences for all users that are concurrently logged on. This, again provides significant cost savings over the standard system modules.

▶ Food & Drug companies need high levels of data security which this module provides.

▶ Traceability of any changes to any transactions on the system can be achieved with this unique capability.

▶ Large volumes of internal purchasing activity can be expensive on licensing. This module reduces this cost.

▶ More licence cost reductions with this module when you need large amounts of shop floor reporting.
