

## Additional Modules (2)

### OVERVIEW

As well as the outstanding portfolio of standard functionality, **Priority** boasts a wealth of additional modules designed to enable companies in specific industries to gain advantage over their competitors. Business areas not normally catered for within ERP systems are now dealt with uniquely within the **Priority** solution.

### QUALITY ASSURANCE

Companies dealing with high value, complex, or chemical products will invariably require sophisticated tools for managing the quality of their products, manufacturing processes and raw materials. In three process streams (supplier, manufacturing and customer transactions) this module provides the tools to be able to manage the quality of the product, materials and processes. As well as providing data storage and documentation for inspection checks, this additional module also provides statistics and reporting to allow management to make informed decisions about their own and their suppliers' performance.

### SAFETY

There are many organisations which deal with hazardous materials and processes and consequently need to ensure their business procedures deal adequately with them. This module manages health and safety checks (who carries them out, what needs to be done, etc) and helps the organisation maintain a hazard log. Emergency / safety teams and equipment are managed and special functionality is available for documenting the handling of hazardous materials.

### ACCUMULATED INVOICING

Within the construction industry, it is important to not only invoice according to consumption but to identify past consumption levels as well. This module provides specific functionality to satisfy this particular vertical industry requirement.

▶ **Making the most of your Priority investment with specific additional functionality.**

▶ **Quality of products and quality of processes are becoming increasingly important in today's world of service differentiation.**

▶ **Management of safety is vital in specific industries, Priority helps you in this important aspect.**

▶ **Accumulated invoicing is a prime example of industry-specific functionality.**

## CONFIGURATOR

Many businesses provide products that are in themselves non-standard, but are made up of standard components. Sometimes these components are built in a wealth of different configurations. These configurations can number many thousands and are totally impractical to model prior to the customer sale. In this situation the Priority Configurator uses a rules-based philosophy to determine how a product should be built, named, described, costed and manufactured. The rules are user-defined and can be used to determine nearly any of the final product's attributes.

► **Product configuration is a complex arena for manufacturing organisations. *Priority* adds this function seamlessly.**

## PERSONAL DIGITAL ASSISTANT INTEGRATION

Many professionals today are moving away from the laptop as their main digital tool. The PDA is taking over as the electronic assistant that organises the modern professional's working life. For this to be effective however, the back-office systems that the rest of the organisation uses must be available on the same platform. ***Priority*** is available for use on PDA devices working with the Bluetooth protocol. This arrangement allows the user to access the office Priority system remotely to fulfill whatever function is required. Most common applications are Appointment journals, Sales orders (credit limits & receipts) and Field Technician reporting (labour and material issue).

► **Engineers and sales professionals on the road can now have the unprecedented levels of integration with your back-office systems.**

## RF BARCODE DEVICE INTEGRATION

Large inventory-based organisations need to handle large inventory volumes which, in turn, requires large warehouse areas in which to house that stock. This means that picking transactions are difficult unless radio frequency devices can be used to assist in this task. It is therefore imperative that your inventory management system can provide data to and accept data from such devices so that the RF device acts as an integrated extension of the management system. ***Priority*** has such a module so that warehouse staff can carry out their normal tasks without having to needlessly run back to the nearest base station to update the system.

► **Large warehouse areas need specific tools to allow staff to maintain their efficiency and not waste time making needless journeys.**
